

LT3070 5A, Low Noise, Programmable Output, 85mV Dropout Linear Regulator

DESCRIPTION

Demonstration circuit 1433 is an adjustable 5A linear regulator featuring LT3070. LT3070 is a low dropout voltage, UltraFastTM transient response linear regulator. The device supplies up to 5A of output current with a typical dropout voltage of 85mV. A 0.01µF reference bypass capacitor decreases output voltage noise to $25\mu V_{RMS}$. The LT3070's high bandwidth permits the use of low ESR ceramic capacitors.

Output voltage is digitally selectable in 50mV increments over a 0.8V to 1.8V range. A margining function allows the user to tolerance system output voltage in increments of $\pm 1\%$, $\pm 3\%$ or $\pm 5\%$. To maintain proper performance and regulation, the BIAS supply voltage must be higher than the IN supply voltage. For a given V_{OUT}, the BIAS voltage must satisfy the following conditions:

 $2.2 \le V_{BIAS} \le 3.6V$ and $V_{BIAS} \ge (1.25 \cdot V_{OUT} + 1V)$.

For $V_{OUT} \le 0.95V$, the minimum bias voltage is limited to 2.2V.

The IC incorporates a unique tracking function to control buck regulator powering the LT3070's input. This tracking function drives the buck regulator to maintain the LT3070's input voltage to V_{OUT} + 300mV, minimizing power dissipation. It has internal protection includes UVLO, reverse-current protection, precision current limiting with power foldback and thermal shutdown.

The LT3070 regulator is available in a thermally enhanced 28-lead, 4mm×5mm QFN package.

The LT3070 datasheet gives a complete description of the part, operation and application information. The datasheet must be read in conjunction with this quick start guide for demo circuit 1433.

Design files for this circuit board are available. Call the LTC factory.

| Performance | Summary | (T _A | = | 25 ⁰ C) |
|-------------|---------|-----------------|---|--------------------|
|-------------|---------|-----------------|---|--------------------|

| PARAMETER | CONDITION | VALUE |
|---------------------------------|-------------------------------|----------|
| Minimum Input Voltage | $V_{OUT}=1.2V$, $I_{OUT}=5A$ | 1.32V |
| Maximum Input Voltage | | 3V |
| Minimum Bias Voltage | V _{OUT} =1.2V | 2.5V |
| Maximum Bias Voltage | | 3.6V |
| Output Voltage V _{OUT} | JP1=LOW, JP2=HIGH, JP3=HIGH | 1.2V ±1% |
| | JP4=LOW, JP6=FLOAT | |
| Maximum Output Current | V_{IN} - V_{out} < 0.5V | 5A |

QUICK START PROCEDURE

Demonstration circuit 1433 is easy to set up to evaluate the performance of the LT3070. Refer

to Figure 1 for proper measurement equipment setup and follow the procedure below:

- 1. Place JP5 on the ON position.
- 2. Use JP1, JP2, JP3, JP4 and JP6 to set the desired output voltage.
- 3. With power off, connect the input power supply to Vin and GND.
- 4. Connect the bias voltage to Vbias and GND.
- 5. Turn on the power at the input and the bias pin.

 $\tt NOTE$. Make sure that the input voltage does not exceed 3V and the bias voltage is within its limit.

6. Check for the proper output voltage.

 $\tt NOTE$. If there is no output, temporarily disconnect the load to make sure that the load is not set too high.

7. Once the proper output voltage is established, adjust the load within the operating range and observe the output voltage regulation, efficiency and other parameters.

 ${\tt NOTE}$. Make sure that the power dissipation is limited below the thermal limit.
